# Project Management Services

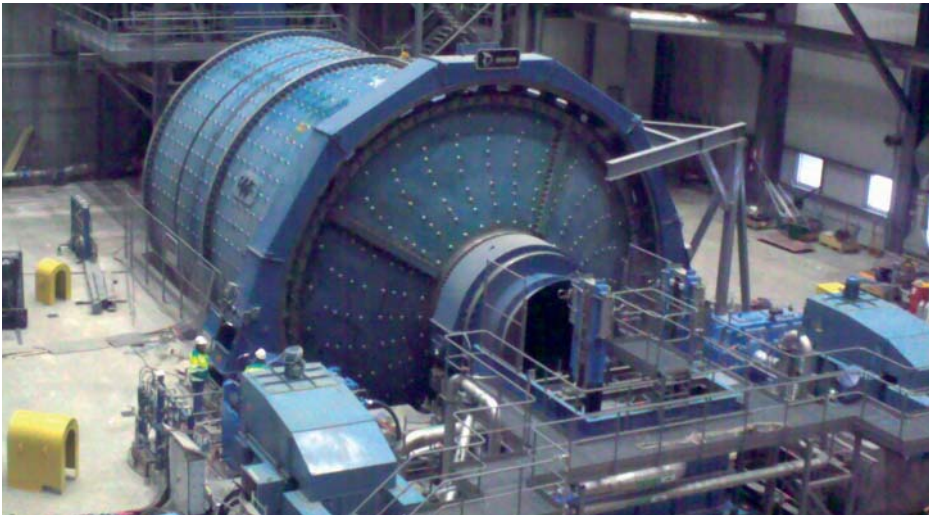

Comatec offers project management services tailored to client needs. Our operations conform to SFS-EN ISO 9001 quality management standards. Comatec takes on responsibility for a project and puts together a team of experts and designers needed in different fields. Projects can comprise individual design projects for clients or larger all-inclusive packages, for example the delivery of a complete production plant, depending on client requirements.

## Case: Installation project

In supply and commissioning projects, Comatec is responsible for all aspects of installing machinery and equipment. Supply and commissioning projects demand a wide range of knowhow, from logistics and work safety to documentation and preparing structural drawings. Comatec makes the practical arrangements for the installation work and oversees the installation in respect of the working methods, schedule, quality and costs.

Comatec manages the concept and detailed design of equipment and, for example, steel structures, as well as competitive tendering, resourcing, construction supervision, logistics and site services. Supply and commissioning projects are carried out in close cooperation with the client, ensuring that the start-up of production remains on schedule and that the implementation of equipment and machinery is cost-effective.

A successful installation project requires effective project management. Comatec offers the client solid experience in managing installation projects. Comatec's project managers are familiar with the standards and regulations that govern installations in their field, and ensure the overall success of the project. The project managers are in charge of the project and decisions are taken in cooperation with the client.

”

*The project was well managed in every respect.”*

Customer satisfaction survey, 2012

## Examples of our services for installation projects:

- Time, cost and risk management
- Sourcing and competitive tendering
- Construction and delivery supervision
- Installation planning and supervision, documentation
- Management of site and delivery logistics
- Site safety
- Pilot runs and commissioning
- Network projects: products and services produced jointly by a team of experts
